Project Gameplan: My Spots

Get to your spots. Efficient, not fancy. Same moves, every project.

1 See the shot

Picture the end result. What should the finished program look like?

2 Draw up the play

Write a step-by-step `# TODO` checklist for the program, plus a roadmap.

3 One possession at a time

Do one TODO at a time. Run the program after every step, no matter how simple. Once it works, **“hide”** that step: mark its `# TODO` comment line as done. The code itself stays in and keeps running. Then move to the next one.

4 Missed shot? Watch the film

Got an error? Go back to that step and trace it yourself first. Still stuck? Bring Practice Coach the steps done so far. Hints only, **never** the answer.

5 Clean up the game

When the code is done, put any repeated code into a function and simplify the rest.

6 Practice tomorrow

Practice Coach logs every spot I got stuck on and turns it into flashcards, a pop quiz, and read-and-fix rounds for the next day. Next day: do a rebuild, and watch Bro Code or another YouTuber on the parts I missed, before moving to the next course day.

Side rule: Name every variable so it's easy to understand at a glance.

Side rule: Add a docstring to every function I create so I know what it's for.

```
def process_coins():
    """Ask for coins and return the total in dollars."""
```
